Project Overview

1.1. Project Goal

The primary goal of this internship project was to design and develop a modern, accessible, and informative website for the Harari Regional State Labor and Social Affairs Office. The website serves as a central point of information for the public, showcasing the office's services, news, and mission. A key objective was to implement a simple content management system (CMS) that could be operated without a dedicated backend server, empowering non-technical staff to update the website.

1.2. Scope

- In-Scope:
 - Development of a complete, static frontend website with multiple pages.
 - Creation of a client-side administrative panel using HTML, CSS, and Vanilla JavaScript.
 - Implementation of local data storage for the admin panel using the browser's `localStorage`.
 - Integration with third-party services for form handling (Formspree) and live chat (Tawk.to).
 - Structuring the site to be "multi-language ready."
- Out-of-Scope:
 - Backend server development.
 - Database design and integration.
 - Server-side user authentication.
 - Implementation of full-text search functionality.

1.3. Target Audience

- Citizens of the Harari Region seeking information on social programs and labor rights.
- Job seekers and employers.
- Individuals with disabilities and the elderly seeking support services.
- Partner organizations and government bodies.

Technical Specifications

2.1. Technology Stack

- Frontend: HTML5, CSS3, Vanilla JavaScript
- Styling: Custom CSS files (`style.css`, `address.css`).
- Icons: Font Awesome library for iconography.
- External Services:
 - Formspree: Used to handle contact form submissions without a backend.
 - Tawk.to: Embedded live chat widget for user interaction.

2.2. File & Directory Structure

The project is organized with a clear and logical structure to separate concerns.

```
/
├── index.html      # Main landing page
├── about.html      # About the office, mission, vision
├── service.html    # Details of services offered
├── news.html       # Main news page
├── news2.html      # Paginated news page
├── photogallery.html # Photo gallery
├── office.html     # Office structure and team members
├── address.html    # Contact page with Formspree form
├── admin-login.html # Login page for the admin panel
├── admin.html      # The admin panel interface
├── style.css       # Main stylesheet for all pages
├── address.css     # Specific styles for the address page
├── script.js       # Main JavaScript for interactivity
└── image/         # Contains all images, logos, and icons
```

Features and Functionality

3.1. Public-Facing Website

The public site consists of several key pages designed for clarity and ease of navigation:

- Home ([index.html](#)): The main landing page featuring a hero section, an overview of the office's mission and vision, a preview of the latest news articles, and links to partner organizations.
- About Us ([about.html](#)): Provides detailed information on the office's vision, mission, core values, and key responsibilities to the community.
- Services ([service.html](#)): Describes the main services provided by the office, with a focus on social protection, employment opportunities, and support for vulnerable groups within the region.
- News ([news.html](#), [news2.html](#)): Displays recent news and announcements in a user-friendly card format. The news section includes pagination to allow users to navigate between pages of articles.
- Photo Gallery ([photogallery.html](#)): A visual gallery showcasing the office's events and activities. The gallery is categorized into Meetings, Activities, and Regional Landscapes for easy browsing.
- Office ([office.html](#)): Presents the organizational structure of the office and introduces the key management personnel with their roles and photos.
- Contact Us ([address.html](#)): Contains all necessary contact information, including the physical address, phone number, email, and business hours. It also features an embedded map for directions and a fully functional contact form.

3.2. Client-Side Administrative Panel

A core feature of this project is a content management system built entirely with frontend technologies, allowing for website updates without backend access.

- Access & Authentication:
 - The panel is accessed via the [admin-login.html](#) page.
 - Authentication is handled by a simple JavaScript check against hardcoded credentials:
 - Username: [admin](#)
 - Password: [admin](#)
- Content Management Modules: The admin panel ([admin.html](#)) is a single-page application with user-friendly sections for:
 - Manage News: A form to add new articles (including title, date, a unique slug, image URL, and content) and a list of existing articles with options to edit or delete.

- **Manage Pages:** Simple text areas to update the Mission, Vision, and Values content that appears on the `about.html` page.
 - **Photo Gallery:** A form to add new images to the gallery, complete with captions and categories. Existing photos can be deleted with a single click.
 - **Programs & Services:** A form to add or delete the various services and programs listed on the site.
- **Data Storage (`localStorage`):**
 - Crucially, all content created in the admin panel is stored in the browser's `localStorage`.
 - This means the data is tied to the specific browser on the specific computer used to create it. It is not stored on a centralized server.
 - **Warning:** Clearing the browser's cache, history, or site data will permanently delete all website content that was added through the admin panel.
 - **Data Export:**
 - An "Export JSON" feature is provided as a safeguard. This allows the administrator to download all content from `localStorage` into a single `harari-admin-data.json` file. This serves as a manual backup mechanism.

3.3. Third-Party Integrations

- **Formspree:** The contact form in `address.html` is configured to submit data to a Formspree endpoint. Formspree processes the form data and emails it to the registered address, effectively bypassing the need for a dedicated mail server.
- **Tawk.to:** A JavaScript snippet is included in the HTML files to load the Tawk.to chat widget. This allows visitors to communicate with office staff in real-time, improving engagement and support.

Code Conventions

4.1. Internationalization (i18n)

The HTML is structured to be "translation-ready." Text elements that are intended to be translated have a `data-i18n="key"` attribute. In the future, a JavaScript function can be developed to read the browser's language setting and dynamically replace the content based on a language JSON file that corresponds to these keys.

Future Development Recommendations

- **Backend & Database Implementation:** The highest priority for future development should be to build a proper backend (e.g., using Node.js/Express) and connect it to a secure database (e.g., MongoDB or PostgreSQL). This would solve the data persistence and centralization issues.
- **Secure Authentication:** Implement a robust, server-side authentication system for the admin panel. This should include features like hashed passwords, user roles, and session management to ensure secure access.
- **Full i18n Implementation:** Create the necessary language files (e.g., `en.json`, `am.json`, `om.json`) and write the JavaScript logic to enable the language-switching functionality, making the site truly multilingual.
- **Content Search Functionality:** Once a backend and database are in place, a search feature could be added to allow users to easily find specific news articles, services, or information across the entire website.
- **Deployment and Hosting:** Plan for a formal deployment to a web hosting service to make the website publicly accessible under a dedicated domain name.
